
Homlle safety training

UK awareness workbook • Draft v0.4 • 15 September 2026

COSHH and PPE | Manual handling | Safe visits

For cleaners and beauticians. Use this workbook with the three captioned, narrated videos. The content is written around official HSE and HSENI guidance and original Homlle scenarios. It is not accredited, HSE-approved, an official qualification or evidence of practical competence on its own.

How to use the series

Watch the relevant lesson with captions or use the transcript. Ask for language or accessibility support if needed.

Answer the knowledge questions before checking the answers. A competent assessor must correct gaps and observe the task-specific practical checks.

Record the actual equipment, products, assessment version, assessor and outcome. Work independently only after the responsible person authorises the assessed scope.

Before Homlle uses these lessons

A competent safety reviewer must approve the material for the actual services, territories and risks. Provide approved products, current safety data sheets, task assessments, suitable equipment and PPE, emergency arrangements and an available duty contact. Confirm worker status and legal responsibilities; calling someone self-employed does not decide those duties.

Scope and remaining specialist training

These are foundation lessons. They do not replace first-aid training, work-at-height or electrical safety training, infection-control procedures, specialist waste or sharps handling, treatment qualifications, treatment-specific contraindication/allergy precautions, respirator fit testing, or moving-and-handling-people training. Do not allocate those activities without the appropriate controls and competence.

UK framework and responsibilities

COSHH

Great Britain: Control of Substances Hazardous to Health Regulations 2002, as amended. Northern Ireland: Control of Substances Hazardous to Health Regulations (Northern Ireland) 2003, as amended. Assess exposure, prevent or adequately control it, maintain controls and provide information, instruction and training. The competent assessment determines any exposure monitoring or health surveillance required; reporting symptoms is not a substitute.

Manual handling

Great Britain: Manual Handling Operations Regulations 1992, as amended. Northern Ireland has its own Manual Handling Operations Regulations (Northern Ireland) 1992. Avoid hazardous handling where reasonably practicable; assess unavoidable tasks and reduce injury risk. A lifting-technique video does not remove the need to redesign an unsafe task.

PPE

The Great Britain PPE at Work Regulations 1992 were extended in 2022 to include eligible limb (b) workers. Where the relevant employer duty applies, required PPE must be provided free of charge, suitable, maintained and supported by instruction and training. Hazard-specific legislation such as COSHH may govern the PPE duty. Check Northern Ireland requirements separately before deploying there.

Lone working and local safeguarding

Use a risk assessment, suitable supervision, working contact arrangements and clear limits. Safeguarding referral systems and laws differ across UK nations. Confirm the relevant local authority or service and lead/deputy before work. Immediate danger: call 999; do not wait for an internal reply.

Training review

No universal annual certificate or expiry date is asserted here. Review learning and practical competence when tasks, products, equipment or risks change, after an incident or observed gap, and at a risk-based interval set by the competent reviewer. Keep the records and ensure learners understand the instructions.

Source links and the deployment approval record are at the end of this workbook.

COSHH and PPE: safer products, safer work

Lesson 1 • Scene notes 1–3

01 Start with the task

Welcome to Homlle chemical safety awareness. Before using a product, check that it is approved for the task and that you understand the instructions and task assessment. This short lesson does not qualify you to handle every chemical. If you are unsure, stop and ask a competent person.

02 What COSHH means

COSHH means Control of Substances Hazardous to Health. In Great Britain, the 2002 regulations require risks from harmful substances to be controlled. Northern Ireland has separate 2003 regulations. These lessons support awareness; they are not an accredited qualification. Homlle must arrange competent, task-specific review before using them to authorise work.

03 How exposure happens

A hazard is something that can harm you. Risk depends on how you use it and who is exposed. Think about breathing in sprays, splashes onto skin or eyes, and contaminated hands near food. A beauty product or an everyday detergent can still cause harm. Consider the customer and anyone nearby too.

COSHH and PPE: safer products, safer work

Lesson 1 • Scene notes 4–6

04 The sheet is not the assessment

The safety data sheet helps explain a product, but it is not the assessment of your job. Before work, find the approved method for the product, surface, room and people present. For example, a small bathroom may need a different method from an open work area. If the controls cannot be followed, pause and ask.

05 Control exposure first

First ask whether the hazardous substance or process can be avoided. If not, use a safer approved alternative and controls that reduce exposure, such as an appropriate dispensing method or effective extraction. Protective equipment is an extra layer, not permission to work with uncontrolled exposure. Never substitute products on your own.

06 Keep the label

Check the product name and label before each use. Keep the label readable and follow the manufacturer instructions. Never put a chemical into a food or drink container. An unlabelled bottle is not safe to guess with. Set it aside safely and ask for an approved replacement.

COSHH and PPE: safer products, safer work

Lesson 1 • Scene notes 7–9

07 Never mix products

Do not mix cleaning products, even if both seem familiar. Mixing can create dangerous reactions. More concentrated does not mean safer or better. Follow the stated dilution and method for the product and surface. If a customer asks for a different mixture, explain that you must follow the safe approved method.

08 Protect people and the space

Before starting, check ventilation, storage and the protective equipment specified for this task. Keep products away from children and pets. Gloves must be suitable for the product and in good condition. If you notice skin irritation, breathing discomfort or another concern, stop exposure and report it through the agreed support route.

09 PPE must match the task

PPE means personal protective equipment. The assessment decides whether chemical-resistant gloves, eye protection, protective clothing or other equipment is needed. Check the items fit you and work together. A glove material that suits one product may fail with another. Use the specified material and replacement instructions, not a guess based on colour.

COSHH and PPE: safer products, safer work

Lesson 1 • Scene notes 10–12

10 Use protection properly

Check gloves for damage before use. Follow the trained removal method so the contaminated outside does not touch bare skin. Dispose of single-use gloves correctly; clean reusable equipment only as instructed. Wash and dry your hands afterwards. Gloves do not replace hand hygiene. Report red, itchy or cracked skin early and ask for a review.

11 A mask is not a shortcut

A basic face covering is not protection against chemical vapour. Where a risk assessment requires respiratory protection, a competent person must select equipment suitable for the substance and wearer. Tight-fitting respirators need a face fit test and a fit check each time they are worn. Do not start a respirator-dependent task without the required training and equipment.

12 Beauty work needs its own controls

For beauty work, assess the actual treatment. Nail dust, solvents and repeated wet work need suitable controls; hair products can also cause skin or breathing problems. Use product-specific instructions and any required extraction. This lesson does not qualify you to carry out a treatment or replace consultation, allergy precautions, infection control or practical beauty training.

COSHH and PPE: safer products, safer work

Lesson 1 • Scene notes 13–15

13 Store, close and separate

Keep lids closed and products secured so they cannot spill or be accessed by children or pets. Separate incompatible products according to their instructions. Do not decant into food or drink containers. Use the agreed disposal route for residues and contaminated materials. Do not pour an unfamiliar chemical down a drain. Ask if the route is unclear.

14 When something goes wrong

For a spill or exposure, stop work and keep other people away. Follow the product emergency instructions and get appropriate help. Do not try to neutralise an unknown chemical or enter unsafe air to rescue equipment. In an immediate emergency, contact emergency services. Report the product and what happened.

15 Scenario: the mystery bottle

A customer hands you an unlabelled bottle and says it works well. What should you do? Do not smell it to identify it, mix it or try it on a small patch. Explain that you need an approved labelled product. If none is available, pause the task and contact support.

COSHH and PPE: safer products, safer work

Lesson 1 • Scene notes 16–16

16 Show what you know

Next, complete the knowledge check in the guide. Before you work independently, a competent assessor should confirm that you can find the instructions, use the actual product safely and explain the emergency route. Record the lesson version and assessment. Watching this video alone does not approve you for work. Your assessor should check understanding, correct any gaps and observe the relevant practical skills. Do not treat video completion as automatic permission to work.

Chemical safety: knowledge check

Suggested Homlle assessment rule, subject to approval: all safety questions must be answered correctly after feedback and reassessment. This is an internal learning criterion, not an awarding-body pass mark. Do not pass a learner with an unresolved unsafe response.

1. A customer gives you an unlabelled bottle. What do you do?

Answer: _____

2. Can you mix two familiar products to improve cleaning?

Answer: _____

3. Does a safety data sheet replace the task assessment?

Answer: _____

4. What decides the gloves and dilution?

Answer: _____

5. What is the first response to an unknown spill?

Answer: _____

6. Do gloves make an uncontrolled chemical task safe?

Answer: _____

7. Does one glove or mask protect against every product?

Answer: _____

8. What if the room or treatment differs from the assessment?

Answer: _____

Chemical safety: assessor answers

1. Do not use or identify it by smell; obtain an approved labelled product or pause and escalate.
2. No. Use the approved product and method without mixing.
3. No. It informs the assessment; the actual task and controls still need assessment.
4. The approved task assessment and manufacturer instructions for that product.
5. Stop, protect people, follow the emergency procedure and get appropriate help; do not improvise neutralisation.
6. No. Prevent or control exposure first; use suitable PPE as an additional measure.
7. No. Selection must match the hazard, task and wearer; tight-fitting RPE needs fit testing.
8. Pause and obtain a competent review of the task and controls before proceeding.

Observe the practical task

Ask the learner to identify an approved product and label, locate its instructions and task assessment, explain storage and dilution, select the specified protection, and describe the spill/exposure route. Use a safe demonstration; never create a hazardous incident for training.

Also observe PPE inspection, safe removal and hand hygiene using a safe simulation. Confirm any necessary respirator fit-test record separately. Ask the learner to show the actual emergency instructions and identify when to stop.

Learner / account ID: _____

Date / assessor / competence evidence: _____

Actual task / products / equipment / risk-assessment reference: _____

Observed evidence and corrections: _____

Outcome: Further learning required / Competent for the recorded scope

Restrictions / review trigger / authorising person: _____

Manual handling: plan before you move

Lesson 2 • Scene notes 1–3

01 Plan before moving

Welcome to Homlle manual handling awareness. Moving equipment or supplies can cause injury when the task is not planned. First consider whether hazardous handling can be avoided. If it cannot, assess the task and reduce the risk before starting. This lesson is not a practical lifting qualification.

02 The legal approach

The Manual Handling Operations Regulations 1992 set the Great Britain approach: avoid hazardous handling where reasonably practicable, assess what remains and reduce injury risk. This includes carrying, pushing and pulling, not only lifting. Training alone cannot make an unsafe task safe. Northern Ireland has its own equivalent framework, which must be checked for work there.

03 Four questions before moving

Use four prompts: task, individual, load and environment. How often will you move it? Can you do so comfortably today? Is it awkward, unstable or hard to grip? Is the route clear and well lit? Report pain, fatigue or restrictions privately so the work can be adjusted. There is no single legal safe weight for every person and task.

Manual handling: plan before you move

Lesson 2 • Scene notes 4–6

04 Check the whole task

Look at the load, grip, route, stairs and available space. Think about how often you must move it and your own capability today. There is no single weight that makes every lift safe. A light awkward item on a wet staircase may still be unsafe. Pause if the conditions are unsuitable.

05 Make the task easier

Can you split supplies into smaller loads, use suitable equipment or arrange help? Clear the route before moving anything and check that the destination is ready. Help is useful only when the task is planned together. Do not use a customer as an unplanned lifting assistant for an unsafe task.

06 Use the assessed method

Follow the handling method you have been shown for the actual task and equipment. Keep movements controlled and avoid sudden twisting or jerking. If the load shifts, the route becomes unsafe or you feel pain, stop safely and reassess. Do not push through discomfort to finish a booking faster.

Manual handling: plan before you move

Lesson 2 • Scene notes 7–9

07 Moving a manageable load

For a load already assessed as manageable, plan where it will go and take a stable position. Get a secure grip and keep it close. Use a comfortable posture with some bending at the hips and knees, and move smoothly without jerking. Turn by moving your feet. Put it down before making a precise adjustment. Practise with a competent assessor.

08 Trolleys still need assessment

A suitable trolley may reduce carrying, but pushing and pulling still need assessment. Check its condition, capacity, route and your view ahead. A heavy beauty case can become hard to control on a slope. Do not take ordinary wheeled equipment down stairs. Agree a suitable method or change the task before moving it.

09 Working together safely

A second person does not automatically make a difficult load safe. Team handling must be planned for the load, route and both people. Agree who gives the signal and where to put it down. Either person can stop the move. Do not ask an unprepared customer to take part in a risky lift.

Manual handling: plan before you move

Lesson 2 • Scene notes 10–12

10 Footwear, repetition and symptoms

Use suitable footwear and any grip protection identified by the assessment. PPE does not reduce the weight of a load. Repeated reaching, scrubbing and carrying can build up strain even with small items. Adjust equipment and work organisation, and report discomfort early. Pause an unsafe task instead of pushing through pain.

11 Keep service boundaries

A customer may ask you to move a heavy sofa or help lift a person. These are not automatic additions to a cleaning or beauty booking. Do not attempt unassessed handling outside your competence and approved scope. Explain the boundary and contact support. Protecting safety must not cost you a positive rating.

12 Scenario: the loaded case

Your equipment case is so full that it blocks your view on narrow stairs. Should you carry it carefully anyway? No. Stop and change the plan. Split the load if safe, clear the route or arrange another assessed method. Taking a little longer is better than accepting a foreseeable injury risk.

Manual handling: plan before you move

Lesson 2 • Scene notes 13–13

13 Check and demonstrate

Complete the knowledge check, then demonstrate a safe representative task to a competent assessor. Explain when you would stop and how you would report a hazard or near miss. Record the assessment against this lesson version. A completed video does not prove competence for every load, person or piece of equipment. Your assessor should check understanding, correct any gaps and observe the relevant practical skills. Do not treat video completion as automatic permission to work.

Manual handling: knowledge check

Suggested Homlle assessment rule, subject to approval: all safety questions must be answered correctly after feedback and reassessment. This is an internal learning criterion, not an awarding-body pass mark. Do not pass a learner with an unresolved unsafe response.

1. What comes before a lifting technique?

Answer: _____

2. Is there one safe weight for every person and task?

Answer: _____

3. A case blocks your view on stairs. What next?

Answer: _____

4. Can you move a customer as an extra service?

Answer: _____

5. What if the load shifts or you feel pain?

Answer: _____

6. Is a trolley automatically safe on stairs or a slope?

Answer: _____

7. What do task, individual, load and environment help you check?

Answer: _____

8. Does adding a second person remove the need for assessment?

Answer: _____

Manual handling: assessor answers

1. Consider avoiding the hazardous handling; assess unavoidable work and reduce risk.
2. No. The load, route, frequency, environment and individual capability all matter.
3. Stop and change the plan, for example by safely reducing the load or arranging an assessed alternative.
4. No; that is outside this ordinary service scope and requires appropriate separate competence and assessment.
5. Stop safely, reassess and report the concern rather than forcing the task.
6. No. Assess the equipment, load and route; do not improvise.
7. The actual handling risks, including capability, repetition, grip, space, lighting and route.
8. No. Plan the team movement, signals and safe landing point.

Observe the practical task

Use a safe representative load and route. Ask the learner to assess the task, explain an avoidance or reduction option, check suitable equipment and demonstrate the approved method under supervision. Do not use a heavy or hazardous load to test determination.

Use a safe, representative load and route: identify hazards, select a handling aid if appropriate, check it, demonstrate controlled movement and explain when to stop. Assess stairs or team handling separately if genuinely required; do not use a hazardous lift as a test.

Learner / account ID: _____

Date / assessor / competence evidence: _____

Observed evidence and corrections: _____

Outcome: Further learning required / Competent for the recorded scope

Restrictions / review trigger / authorising person: _____

Safe visits: lone working and everyday safety

Lesson 3 • Scene notes 1–3

01 Know your role

Welcome to Homlle safe visits awareness. Your role is to provide the agreed cleaning or beauty service. You are not a carer, babysitter or investigator. Before working alone, know the named duty contact, check-in plan and emergency route. These arrangements must actually be staffed and tested.

02 Plan a safe visit

Before the visit, check the address, access and known risks. Have a charged phone and an agreed check-in and check-out plan with someone who can respond. An app notification is not an emergency service. If the situation changes or you feel threatened, leave when safe and contact help.

03 A real check-in plan

Before a lone visit, agree who will respond, when contact is expected and what happens if you miss it. A phone notification that nobody monitors is not a safety system. Test the contact route without calling emergency services. If the phone fails or the risk is beyond the agreed limits, move to safety and pause the visit.

Safe visits: lone working and everyday safety

Lesson 3 • Scene notes 4–6

04 Leave an unsafe situation

If you encounter threats, aggression or conditions outside the safe plan, do not argue or try to prove you can cope. Leave safely where possible and seek help. Serious immediate danger needs emergency services. Tell the duty contact once safe. Homlle must set clear limits on what lone workers can do and arrange suitable support.

05 Protect the working area

Cleaning can create hazards for other people. Keep people away from wet slippery floors using suitable barriers or working in sections; a warning sign alone does not prevent access. Keep the exit clear and manage trailing cables. Only reopen the area when safe. Ask for help if you cannot separate the work from customers, children or pets.

06 Notice a concern

You may notice a person being threatened, neglected or pressured for money. Listen calmly and record relevant facts, keeping observation separate from opinion. Do not question people like an investigator, confront a suspected abuser or promise secrecy. Explain that you may need to share information with people who can help.

Safe visits: lone working and everyday safety

Lesson 3 • Scene notes 7–9

07 Urgent danger comes first

If someone is in immediate danger or an emergency crime is happening, call nine nine nine and move to safety if possible. Do not wait for a routine manager reply. Do not attempt an unsafe rescue. Once safe, report through the agreed Homlle route so further protective action can be coordinated.

08 Report securely

For a non-immediate concern, contact the safeguarding lead or deputy promptly and follow the appropriate local authority or police route when needed. Record times, observations, relevant words and actions. Use a secure channel and share only what is necessary. Do not post the situation in a group chat or public review.

09 Scenario: a request for secrecy

A customer says someone is threatening them and asks you to tell nobody. Do not promise secrecy. Listen, explain that help may require sharing relevant information, and assess immediate danger. Follow the safeguarding route and record facts securely. Your job is to raise the concern, not decide the whole case yourself.

Safe visits: lone working and everyday safety

Lesson 3 • Scene notes 10–10

10 Practise the response

Complete the knowledge check and rehearse how to contact help and respond to a missed check-in. A supervisor must confirm that the contact details and escalation plan work. Record the lesson and assessment. This awareness lesson does not replace a safeguarding lead, local procedures or a trained emergency response. Your assessor should check understanding, correct any gaps and observe the relevant practical skills. Do not treat video completion as automatic permission to work.

Safe visits: knowledge check

Suggested Homlle assessment rule, subject to approval: all safety questions must be answered correctly after feedback and reassessment. This is an internal learning criterion, not an awarding-body pass mark. Do not pass a learner with an unresolved unsafe response.

1. Someone is in immediate danger. Who comes first?

Answer: _____

2. Can you promise to keep a disclosure secret?

Answer: _____

3. Should you investigate or confront a suspected abuser?

Answer: _____

4. What makes a check-in plan useful?

Answer: _____

5. Where should the report go?

Answer: _____

6. Is a wet-floor sign enough on its own?

Answer: _____

7. What if no one is available to respond to lone-worker check-ins?

Answer: _____

Safe visits: assessor answers

1. Emergency services on 999 and moving to safety where possible; do not wait for routine internal approval.
2. No. Explain that relevant information may need to be shared with people who can help.
3. No. Record facts, protect safety and use the appropriate reporting route.
4. A named, available person and tested escalation process, not just an unattended notification.
5. Through the secure safeguarding route and relevant external services as needed, with only necessary information.
6. No. Prevent access to a slippery area and only reopen it when safe.
7. Do not rely on the unstaffed system; pause and obtain a workable safety plan before lone work.

Observe the practical task

Use a fictional scenario to rehearse recognising immediate danger, finding the actual lead/deputy details, making a factual secure report and handling a missed check-in. Confirm the duty response is staffed. Do not contact emergency services as a rehearsal.

Confirm both the primary and backup duty contacts are real and available. Rehearse the missed-contact response without contacting emergency services. Use fictional safeguarding details, not a real customer case.

Learner / account ID: _____

Date / assessor / competence evidence: _____

Actual task / products / equipment / risk-assessment reference: _____

Observed evidence and corrections: _____

Outcome: Further learning required / Competent for the recorded scope

Restrictions / review trigger / authorising person: _____

Deployment approval checklist

- [] Competent reviewer has approved the script, visuals, assessment criteria and UK nation/service scope.
- [] Actual COSHH and manual-handling assessments are available and linked to the tasks workers will perform.
- [] PPE selection, issue, maintenance and replacement arrangements are documented; fit testing is arranged where required.
- [] Exposure monitoring and health surveillance needs have been determined by a competent person.
- [] Duty contact, emergency arrangements and local safeguarding routes are staffed, accessible and tested.
- [] Practical assessment is arranged with appropriate equipment and no hazardous training simulation.
- [] Accessibility and language needs are met; understanding is checked rather than inferred from playback.
- [] Training records will identify learner, version, knowledge result, practical assessor, scope, restrictions and review trigger.
- [] The live onboarding system has been separately tested to store those records securely. These local files do not implement or confirm that connection.
